

I. Project 1

Create an authentication system (login, password) for the users to access the solutions on the google cloud (through the link on <https://sueng-tech.com>). The user data should be secure and we should be able to track user behavior (no. of times logged in, time duration of each login, location of the user, which solution accessed etc.) and feedback.

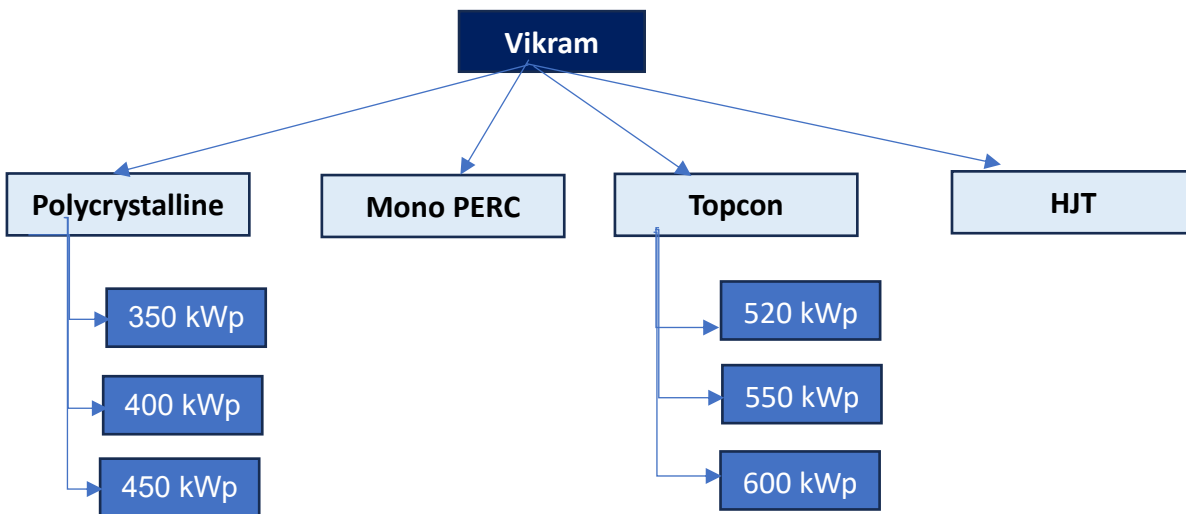

II. Project 2

A. Type of Technology

1. Polycrystalline
2. Mono PERC
3. Topcon
4. HJT
5. Any(choose by manufacturer)

B. Manufacturers

1. Vikram - 350 kWp, 450 kWp, 550 kWp, and so on... modules
2. Warree -various modules
3. TATA - ... various modules
4. Jinko
5. And many more

C. Problem Statement

Create a dropdown of 'type of technology' and 'Manufacturer' for Solar PV modules. Let's say, a user selects 'Topcon' (type of tech) and 'Vikram' (manufacturer), then various available modules (520, 600, 650 etc.) should appear in another dropdown. The user could select any of these (say 550 kWp). Post selection by the user, the module parameters (voltage, current, efficiency etc. as given in the excel sheet) would be sent to the backend.
